

**Long and Freese - Regression Models for Categorical Dependent Variables using Stata, 2nd Edition.**

*Errata as of February 08, 2006*

1. Page 86 as part of the discussion of the robust option, logit and probit were switched. It should read: “For example, if the correct model is a binary probit model and a binary logit model is used, the model is misspecified.” [8 Feb 2006]
2. Page 112, formula for  $BIC_k^S$ : “A third definition, the one that is included with `estimates table` with the `stats(bic)` option and in `estat ic`, is:

$$BIC_k^S = -2 \ln \widehat{L}(M_k) + df_k^S \ln N$$

where  $df_k^S$  is the number of parameters in the model (including auxiliary parameters such as  $\alpha$  in the the negative binomial regression model).” [7 Feb 05]
